

# NIMBUS VS

Secure voting in physical, virtual and hybrid AGMs

ensures that general assemblies are conducted in accordance with the law and statutory provisions

supports single voting, group votes, as well as electoral lists

preserves confidentiality of votes

ensures legal certainty

delivers accurate results in just a few seconds

***Our voting devices are used by approximately 25,000 guests every year and deliver accurate voting and election results in no time.***

Jerry Howe  
Software Development

## ***This is what we do.***

Our electronic voting system evaluates votes and elections in real time, enables anonymous voting and delivers accurate results that are duly recorded and can therefore be published within 15 days, as required by the stock corporation law.

The NIMBUS VotingSystem VS is a self-contained, closed system that has its own radio network. This guarantees top-level security and also ensures there is sufficient bandwidth for evaluations in just a few seconds, even when several thousand shareholders cast their votes.

Our electronic voting units are an integral part of the system. The basic display is customized to the company's identity and every guest receives a device with individual settings. NIMBUS VS supports single voting, group votes, as well as electoral lists.

## ***Interested in getting accurate voting results with us?***

**I will be delighted to assist you!**
